

LIS Seafloor Habitat Mapping Initiative Update

DeAva K. Lambert, LISCF Project Manager
Technical/Coastal Resources
Land & Water Resources Division
CT Dept. Energy & Environmental Protection
Long Island Sound Research Conference
May 18, 2022

Connecticut Department of Energy and Environmental Protection

DEEP Coastal Management Program

- Operating Principle:
 - Balance human needs/uses with protection, preservation & restoration of the natural functions & benefits of coastal environments.

Coastal Management - Context

- Resource Managers need relevant, complete, and accurate information to enable the best possible decision-making.
- Without it, decisions are prone to:
 - Have unintended impacts to resources, communities, and users;
 - Necessitate mitigation and potential litigation.

Part III: Site and Resource Information (continued)

12. Coastal Resource Impact Table
 Check the applicable boxes below to identify coastal resources to be impacted by the proposed activity at the project site. Describe the impacts, as applicable. For definitions, refer to the [Connecticut Coastal Management Manual](#).

Resource Type	square feet			Describe Impacts
	Permanent impact	Temporary impact	Mitigation	
<input type="checkbox"/> Beaches/Dunes below HTL below CJL				
<input type="checkbox"/> Tidal Wetlands				Identify if existing vegetation is salt, brackish or freshwater wetland.
<input type="checkbox"/> Nearshore waters				
Resource Type	Describe Impacts (temporary and permanent)			
<input type="checkbox"/> Benthic Habitat				
<input type="checkbox"/> Intertidal Flats				
<input type="checkbox"/> Submerged Aquatic Vegetation (SAV)				
<input type="checkbox"/> Rocky Shorefront	Include rocky Intertidal areas.			
<input type="checkbox"/> Finfish				
<input type="checkbox"/> Wildlife				
<input type="checkbox"/> Shellfish Areas	Maps available at The Aquaculture Mapping Atlas .			
<input type="checkbox"/> Coastal Hazard Area	Discuss FEMA compliance.			
<input type="checkbox"/> Bluffs/Escarpments	Describe impacts associated with flood and erosion control structures.			
<input type="checkbox"/> Islands	If new access is proposed, describe how Island resources will be impacted.			
<input type="checkbox"/> Coastal Flooding	Describe how tide gates/fill/seawall height increases will impact flooding.			
<input type="checkbox"/> Water Circulation Patterns	Describe impacts from groins/abutments/jetties.			
<input type="checkbox"/> Drainage Patterns	Describe impacts from impervious surfaces/outfalls/weep holes and stormwater modifications.			
<input type="checkbox"/> Visual Quality	Only applies to public views of statewide scenic significance.			
<input type="checkbox"/> Water Quality	Discuss sediment and erosion controls, water handling, and stormwater treatment.			

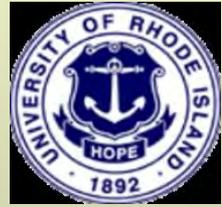

Establishment of the LIS Cable Fund

- June, 2004 Settlement Agreement between CT & NY with the three utility companies created a \$6M fund for research/restoration projects in LIS.
- The fund is managed by a bi-state, multi-agency Steering Committee:
 - Led by CTDEEP, NYDEC, EPA LISS, CT & NY SeaGrants, NYDOS
 - *Priority Goal: provide data products for resource management & infrastructure siting in LIS*

Collaborative Partners Identified (2010)

**Long Island Sound Mapping
and Research Collaborative
(LISMaRC)**

**NOAA Ocean
Service
Collaborative**

NOAA OCS
National Centers for
Coastal Ocean
Science NCCOS

Office of Coast
Survey OCS

**Lamont - Doherty Earth
Observatory Collaborative
LDEO**

Connecticut Department of Energy and Environmental Protection

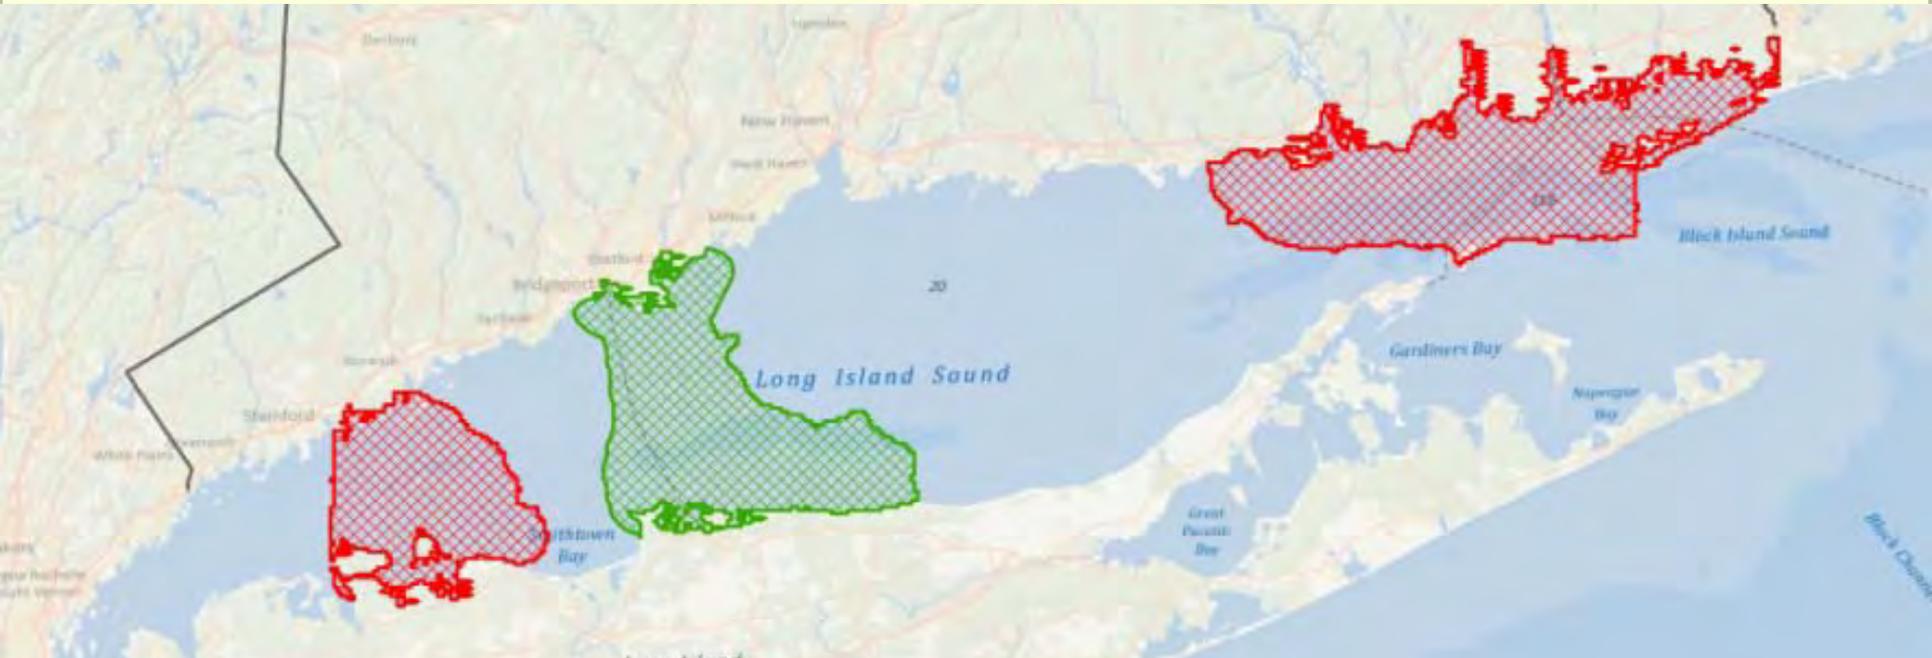

Identifying Mapping Target Areas

- Planning approach developed in 2011 to maximize available funding.
- PGIS support tool devised to promote the interaction and engagement of stakeholders.
- Spatial information used to address decision-making processes about specific landscapes to identify priority mapping areas.

Identifying Mapping Target Areas

Highest Priority Areas for Benthic Mapping in LIS

- Highest Priority Areas selected as target areas

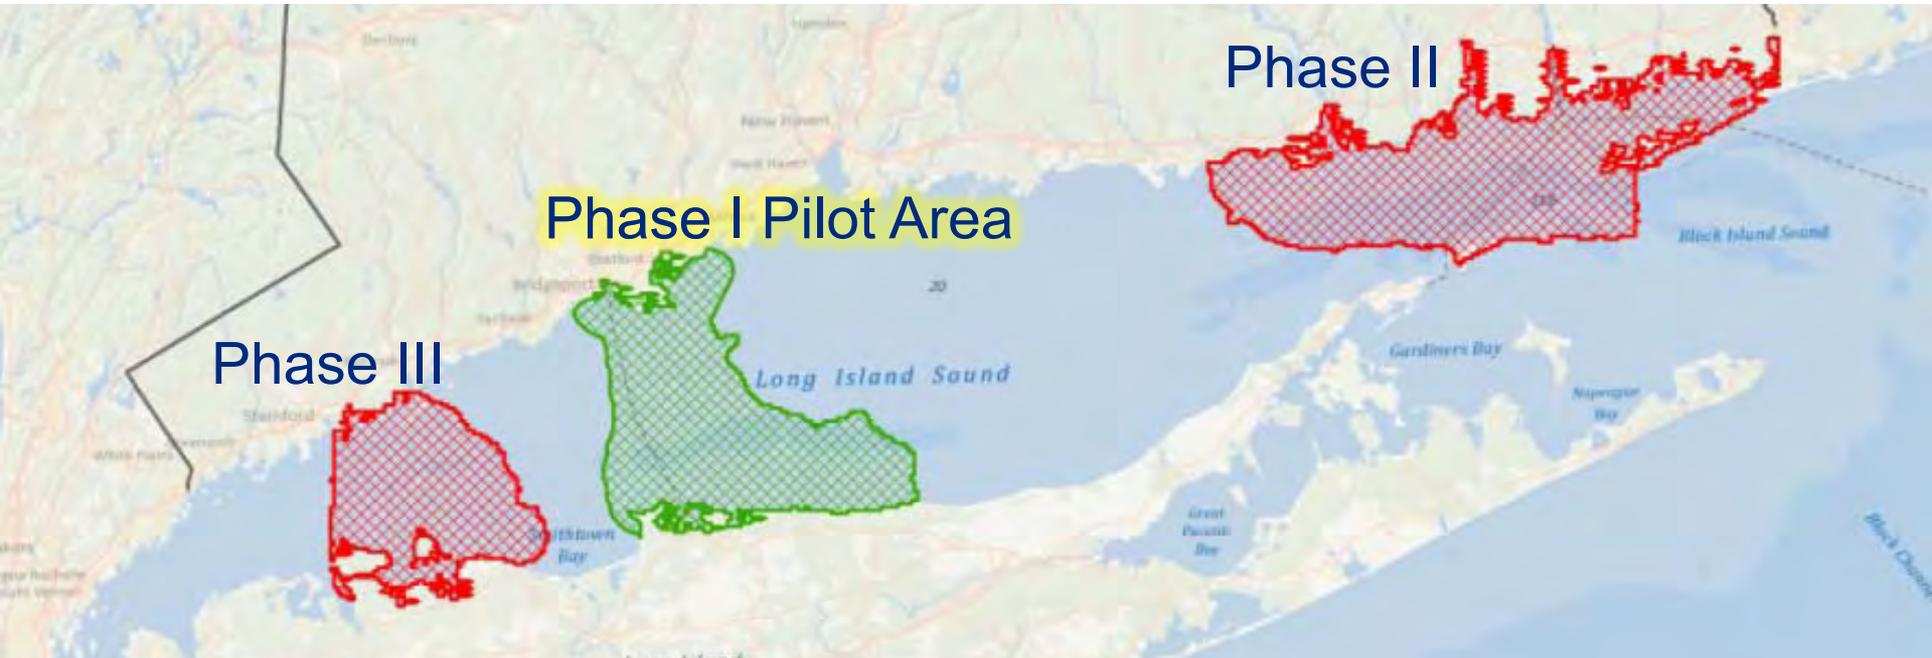

Highest Priority Mapping Areas

- Share core issues of:
 - Regulatory, Planning & Resource Management
- Characteristics supporting core issues:
 - Represent Significant Natural Areas
 - Relevant to Infrastructure
 - Have Knowledge Gaps
 - Have High Use/Potential for Use Conflicts

Highest Priority Mapping Areas

Phase I Pilot Area Mapping Goals

- 2012 – 2015:
 - Define and implement technical components for a mapping program focusing on:

Acoustic Intensity / Seafloor Topography	Benthic Habitats & Ecology
Sediment Texture & Grain Size	Physical Environments
Sedimentary Environments	Data Management System

- Assess implementation strategies
- Report on methods, analysis, results and conclusions/recommendations

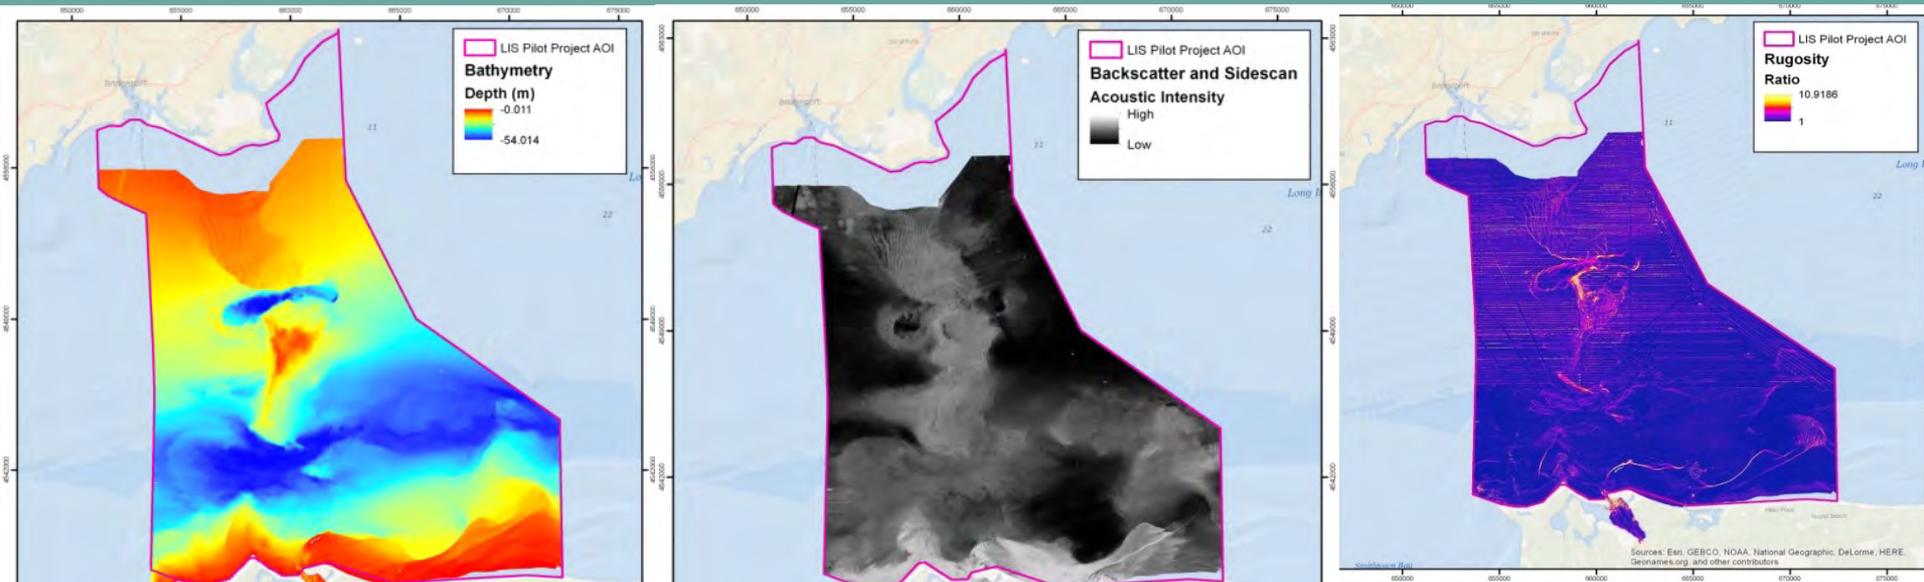

Acoustic Intensity & Backscatter

- Provides depth & backscatter data
- Derives roughness, slope, rugosity
- Most of the other data products directly or indirectly depend on acoustic data

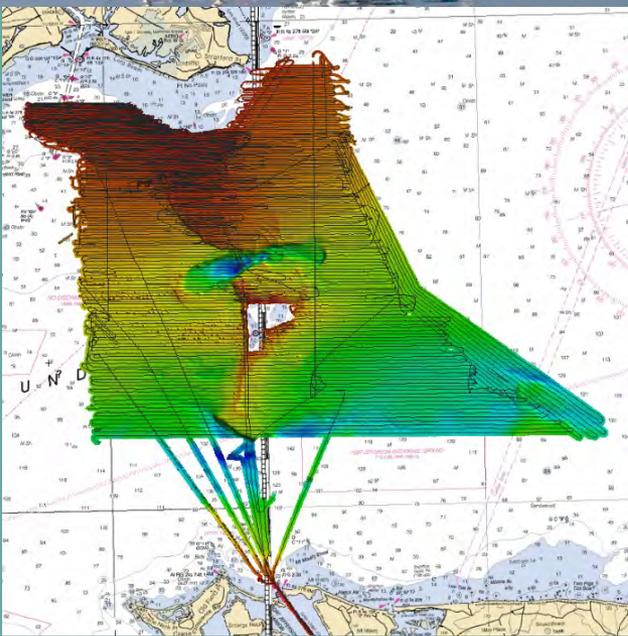

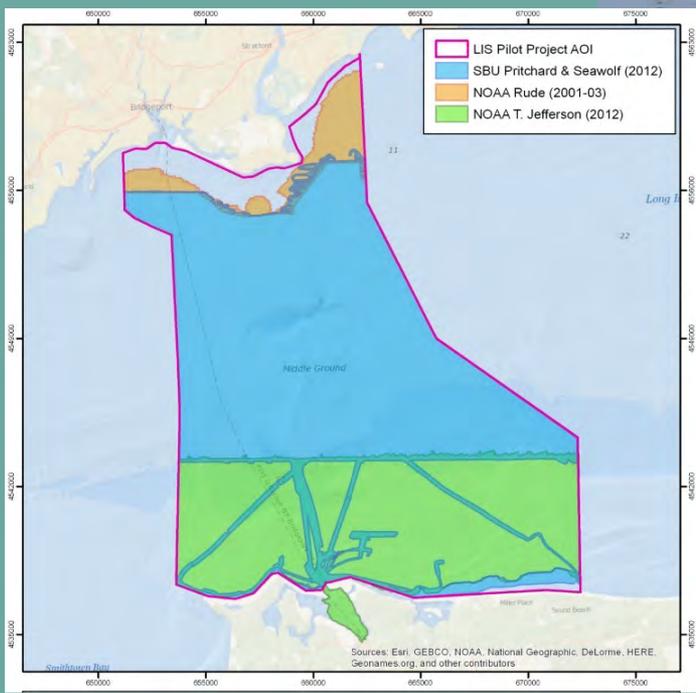

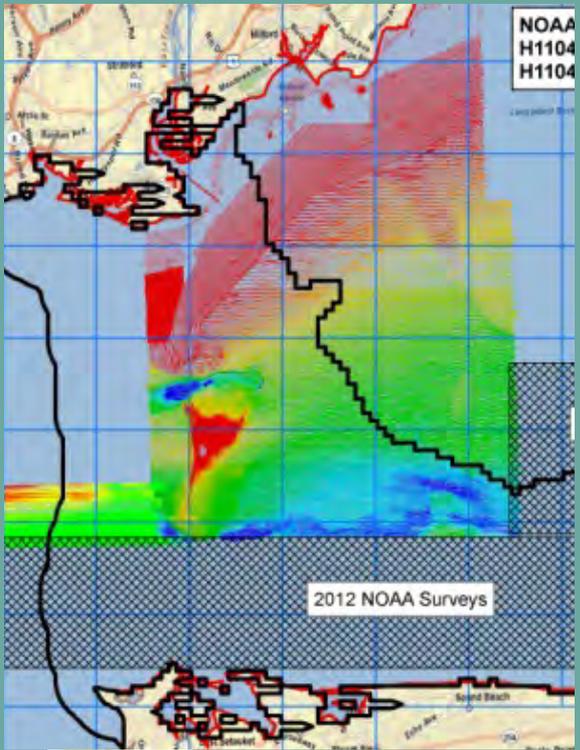

NOAA Survey Vessel
Thomas Jefferson

Existing Acoustic Data

Compilation of:

- previous NOAA data &
- 2012 NOAA & Stony Brook surveys

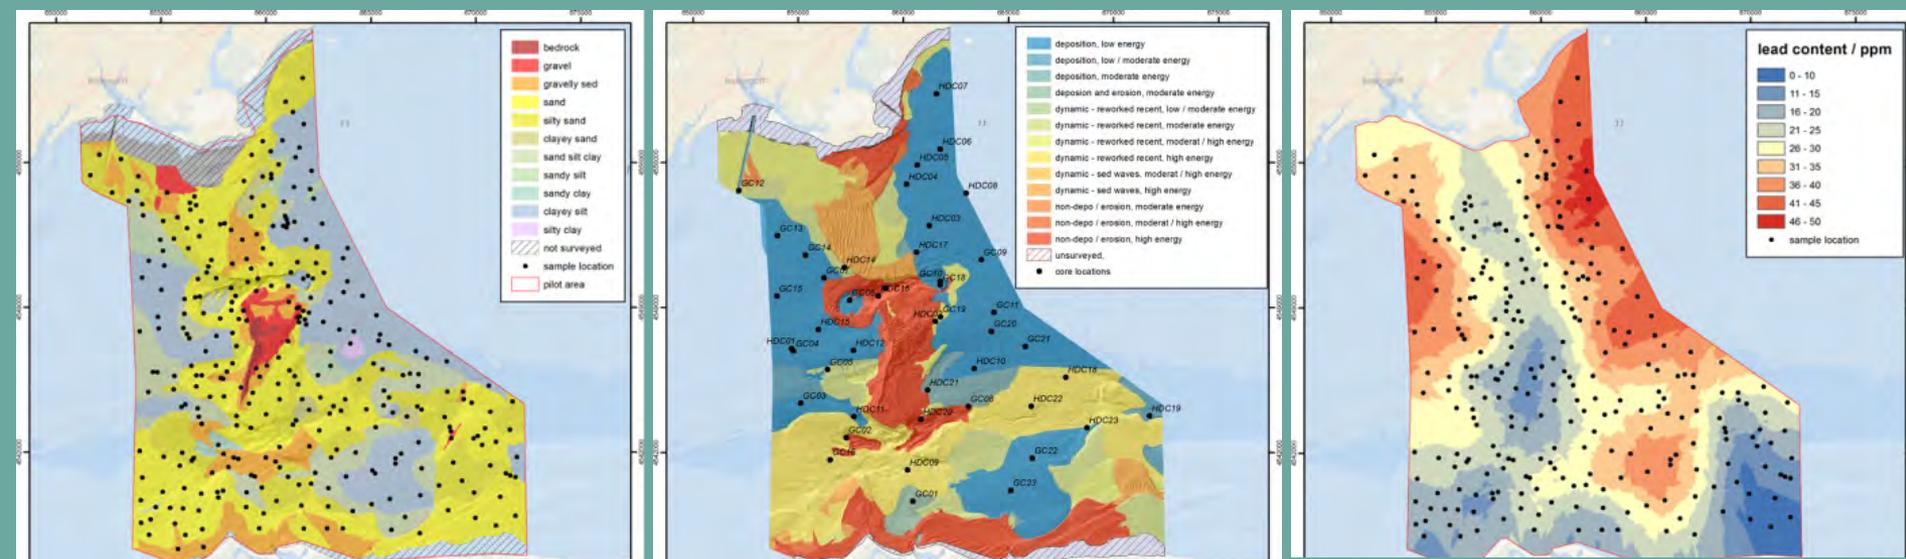

Shallow Water Mapping

- URI conducted Shallow water mapping using an interferometric (vs beam forming) sonar

Sediment Texture & Grain Size

- Provides detailed bottom composition description (e.g., gravel, sand, mud, silt, etc.) and energy dynamics
- Grab samples were also analyzed for sediment chemistry (TOC, N, Pb, Zn, Cu)

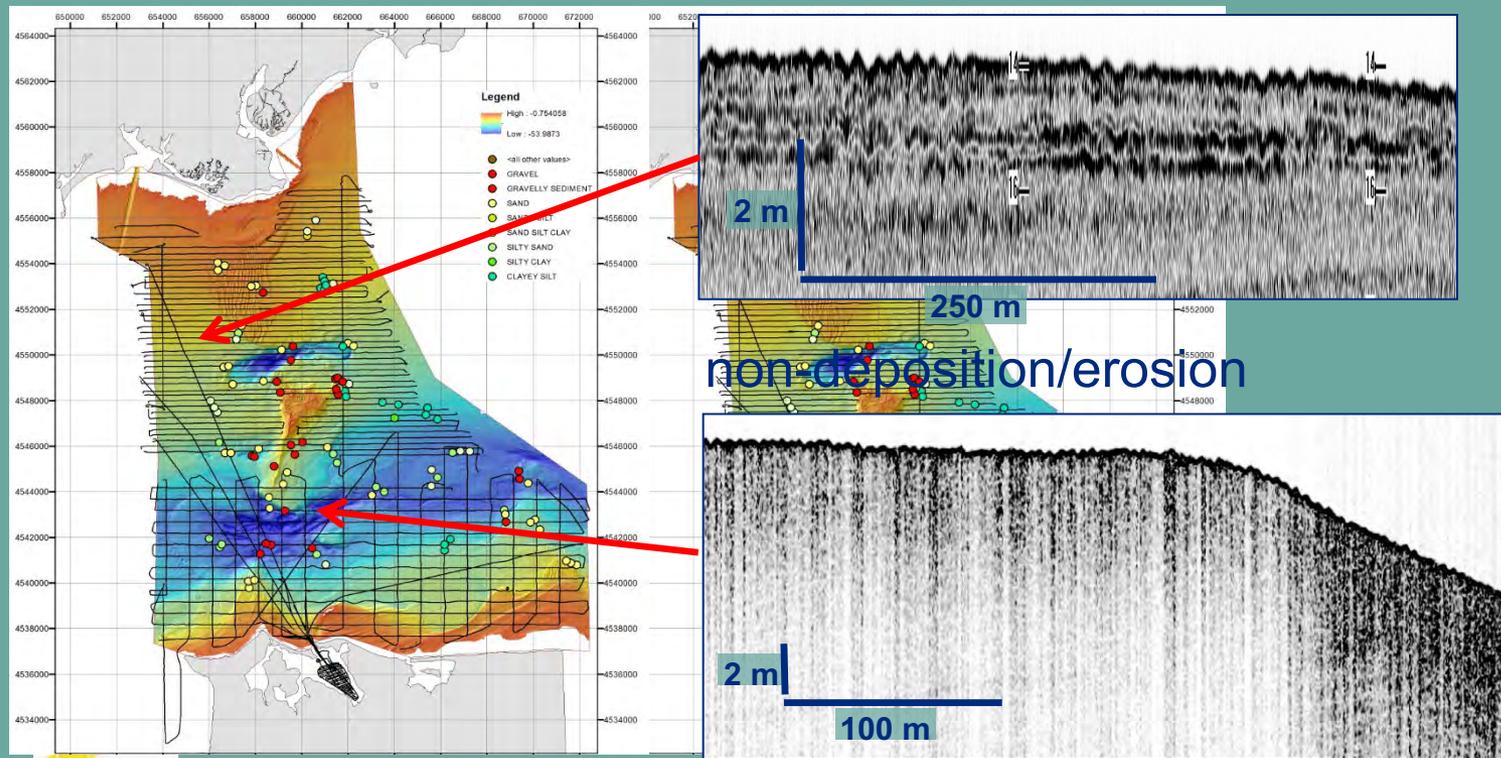

Sedimentary Environments

- Sub-bottom profiling used to develop sediment environments

– Examples:

depositional layers

Ecological Characterization

- Teams characterized benthic habitats using the SEABOSS and Kraken2 ROV.

RV Connecticut

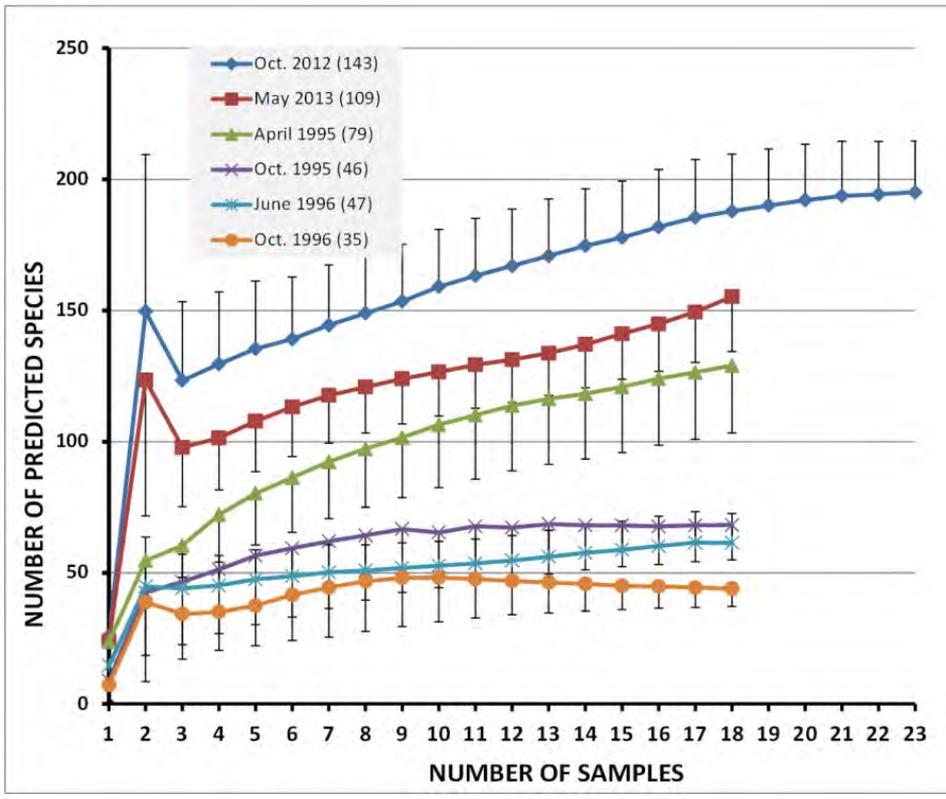

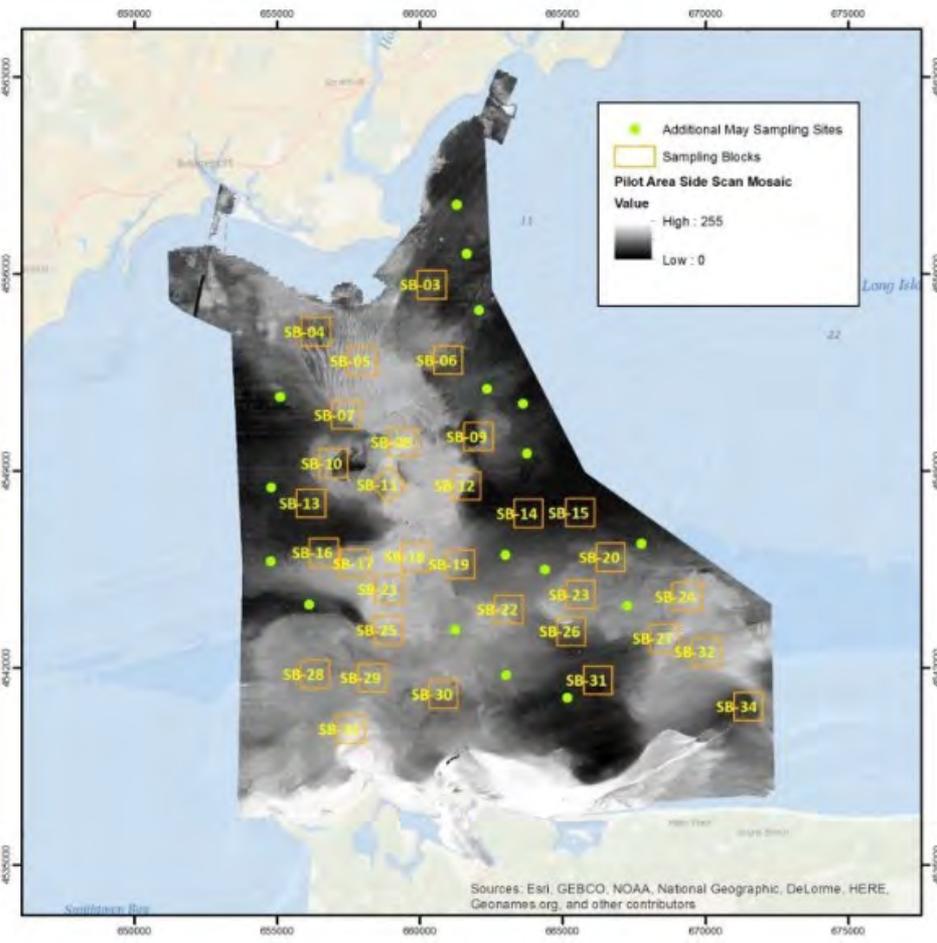

SEABOSS

Kraken2 ROV

Ecological Characterization: Infauna

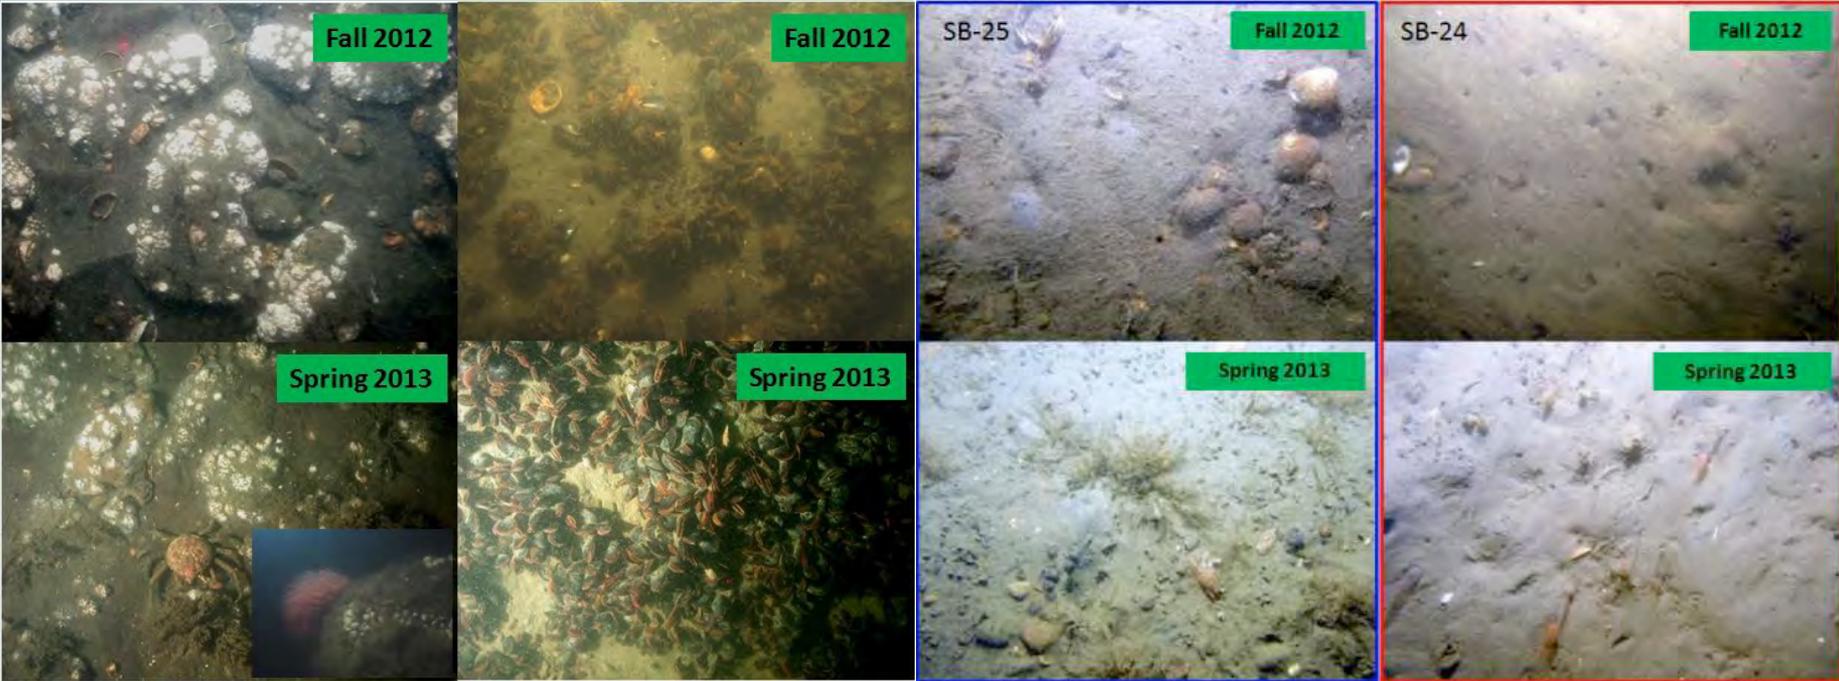

Backscatter data utilized for sample site selection

Connecticut Department of Energy and Environmental Protection

Ecological Characterization: Epifauna

- Seasonal analyses showed ecological stability and change

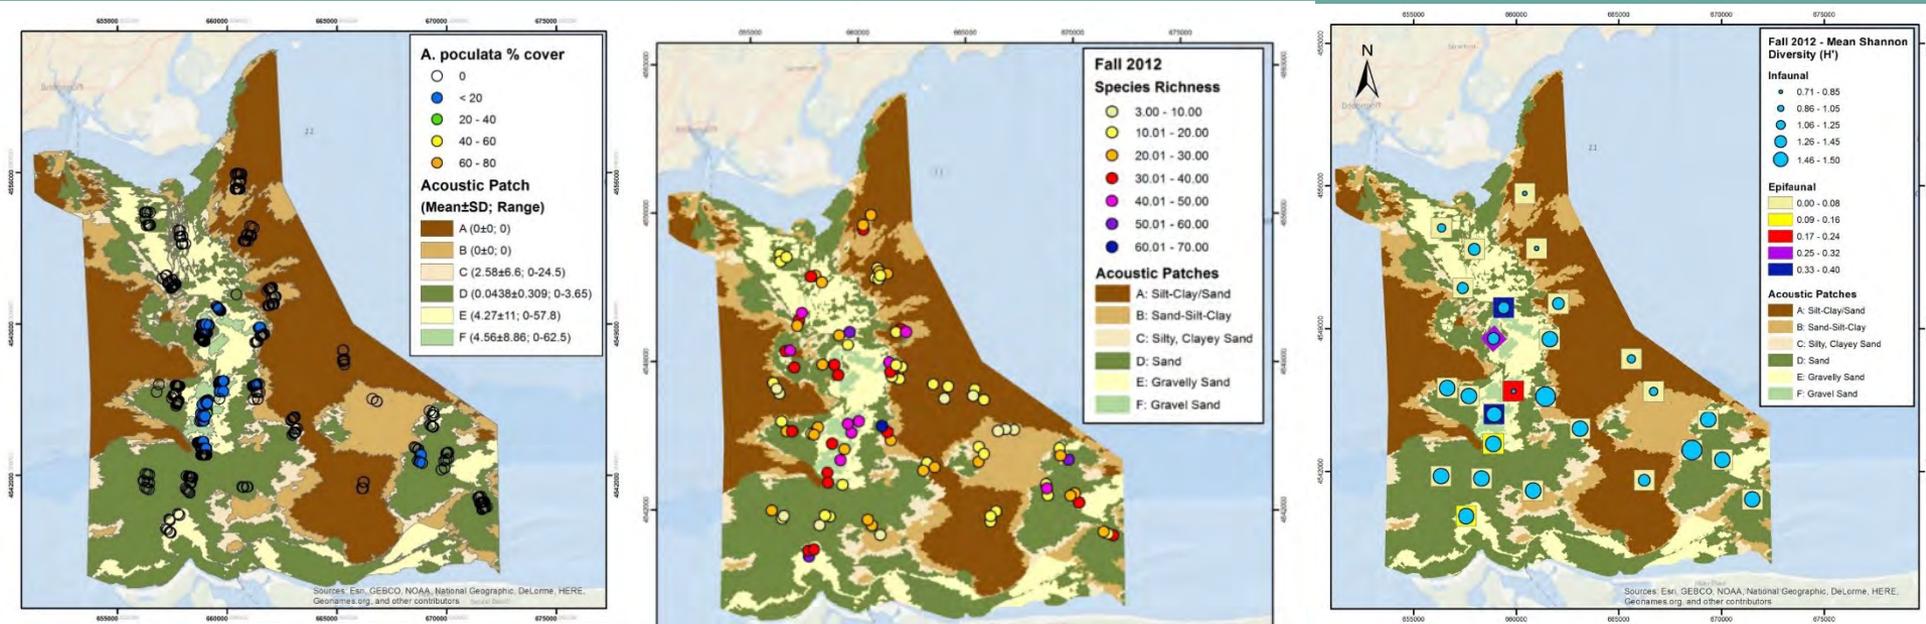

Stable hard substrates

Seasonally variable soft substrates

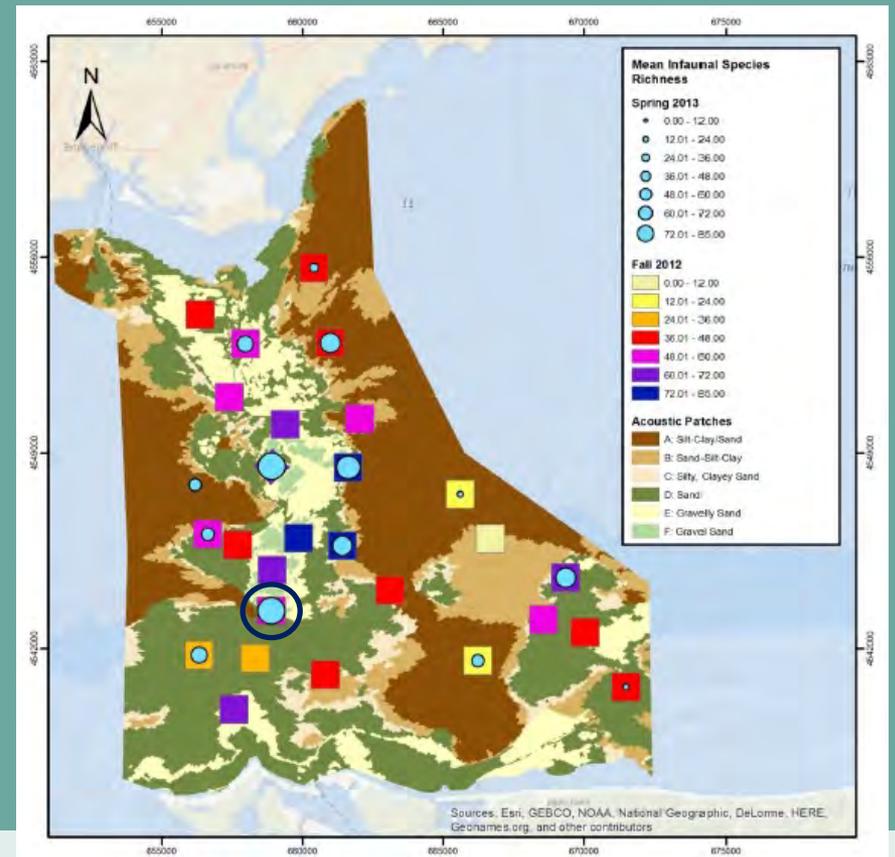

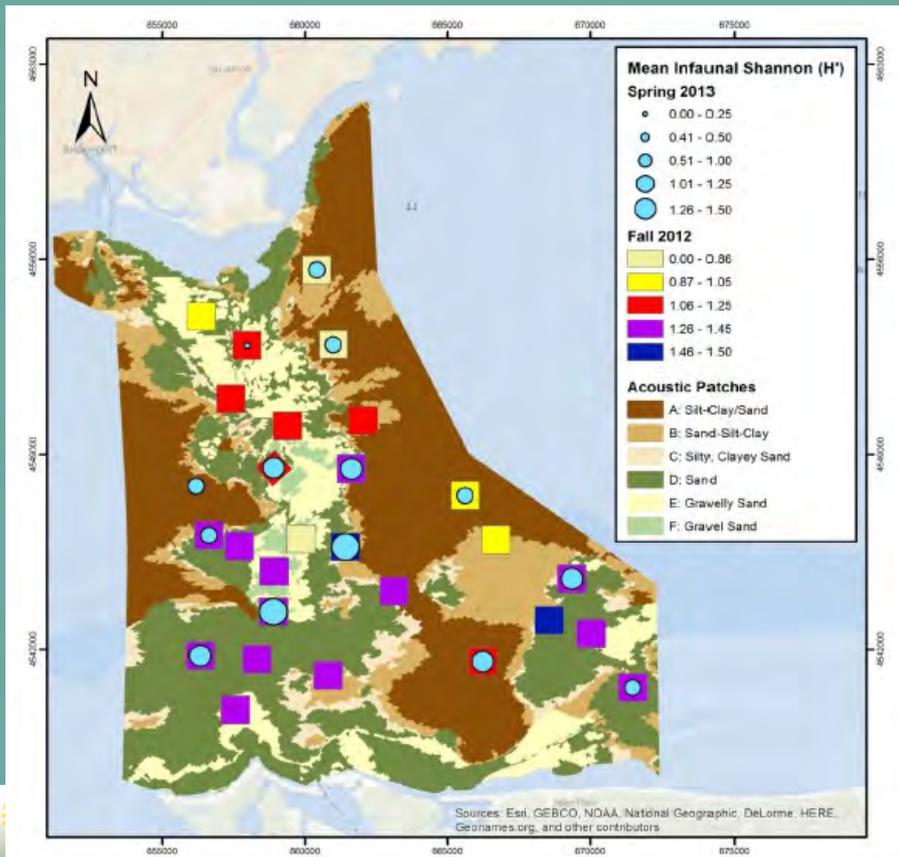

Classification & Ecological Analysis

- Generated numerous data products including individual species distribution, biogenic features, species richness and diversity maps.

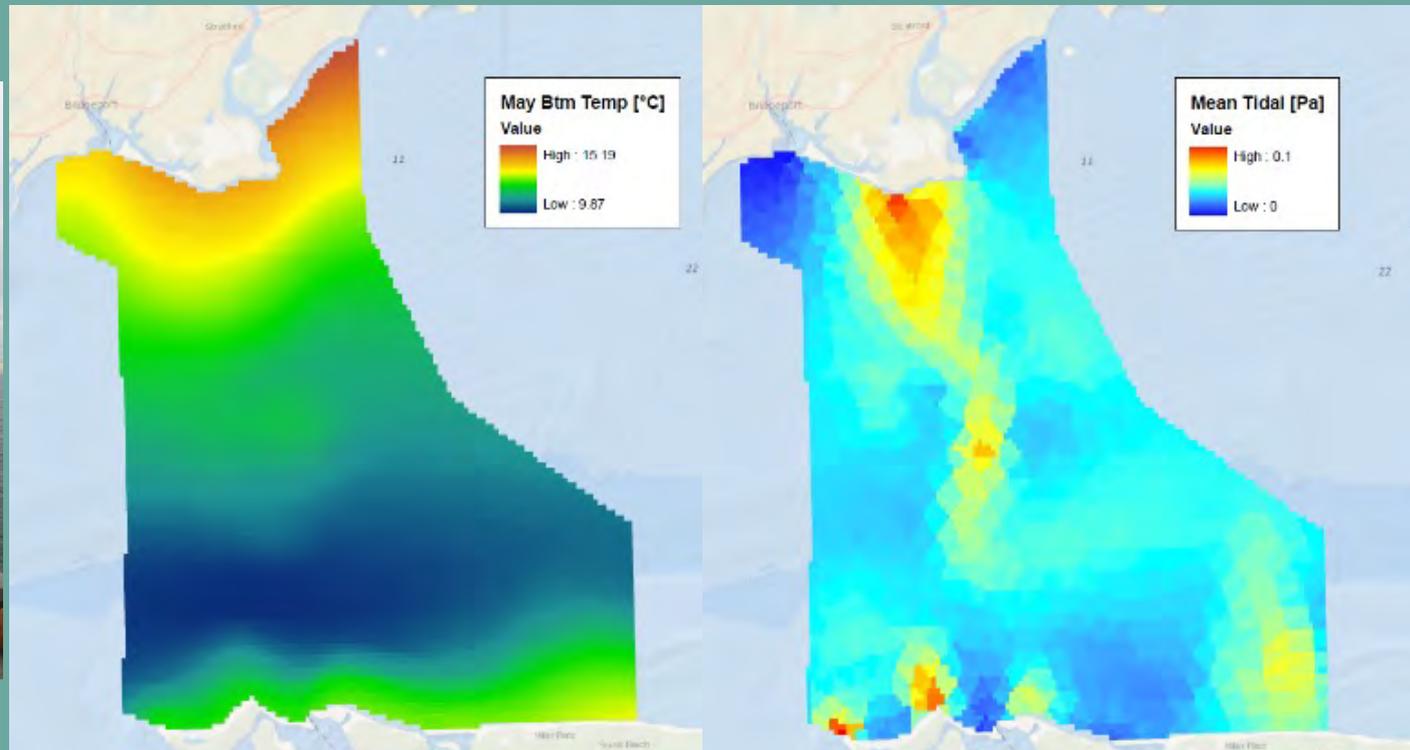

Classification & Ecological Analysis

- Seasonal analyses showed areas with ecological stability and others with seasonal change

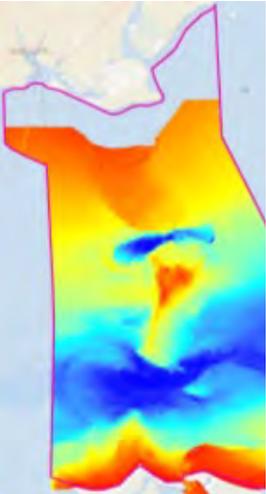

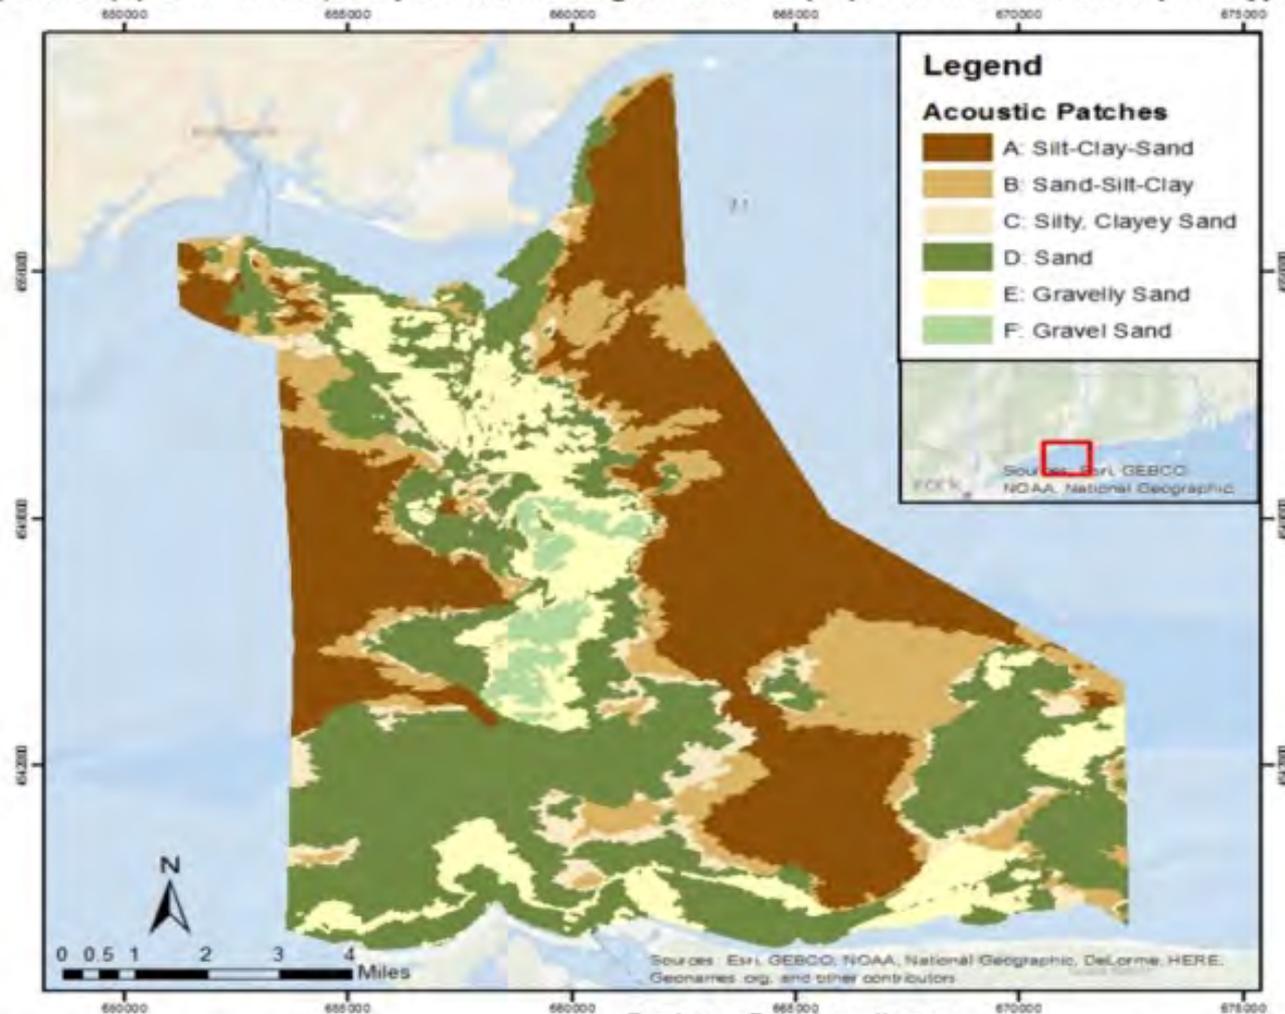

Physical Oceanography

- Data on temperature, salinity, currents, bottom stress, etc., based on observations and modeling.

Integrated Habitat Map

Based on mean bottom tidal stress, defining ecological characteristics of infaunal (I) and epifaunal (E) communities, and predominant biogenic features (BF) in relation to acoustic patch types.

Patch type A: low-medium stress

- I: Mixed burrowing and tubicolous taxa
- E: Solitary ascidians, *Mytilus*
- BF: Shell, burrows

Patch type B: low-high stress

- I: Tubicolous taxa, motile surface feeders
- E: Bivalve, *Corymorpha*, solitary ascidian
- BF: Shell

Patch type C: predominantly medium stress

- I: Variable mix of tubicolous taxa and burrowers
- E: *Mytilus*, *Corymorpha*, solitary ascidian
- BF: Burrows, shell

Patch type D: high-medium stress

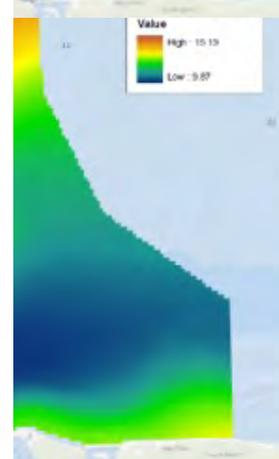

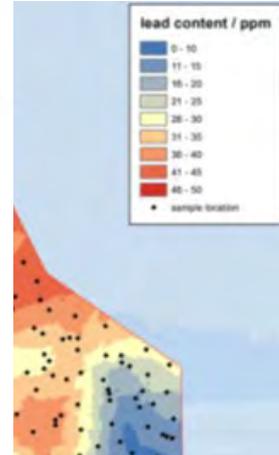

- I: Small tubicolous taxa (polychaetes and amphipods); High density of bivalves
- E: Hydroids, *Mytilus*, barnacle
- BF: High coverage of shell patches and burrows

Patch type E: predominantly high stress

- I: Oligochaetes and archiannelids, small tubicolous taxa, deep burrowing taxa
- E: Hydroids, *Mytilus*, *Astrangia*
- BF: High coverage of shell patches

Patch type F: predominantly high stress

- I: Oligochaetes and archiannelids, small tubicolous taxa (polychaetes and amphipods), moderate bivalve abundances
- E: *Crepidula*, *Diadumene*, *Astrangia*
- BF: High coverage of shell patches

Data Management

- Leveraged an existing NSF funded system at LDEO to store and share results: <http://www.marine-geo.org/portals/lis/>

Connecticut Department of Energy and Environmental Protection

Phase I Findings

Connecticut Department of Energy and Environmental Protection

Bathymetric & Topographic Data

- 
- Critical in guiding subsequent analyses; and
 - Helped to identify changes in decadal seafloor geomorphology.

Geochemical Analysis

- Revealed large- and small-scale variations in sediment distribution, improving on older data;
- Provided a novel look at large-scale surficial concentrations/distributions of several chemical constituents:
 - Advanced current understanding of large-scale grain size distributions while establishing variations on a smaller scale;
 - Sediment cores revealed dramatic change in down-core sedimentation, indicating changes in depositional environments and possibly ecosystems within short-time spans.

Ecological Processes

- Integrating the analyses of spatial and seasonal variation of infaunal and epifaunal communities proved significant:
 - Provided more robust understanding of their:
 - seasonal population characteristics,
 - distributions, and
 - relationships to environmental characteristics.
 - Revealed consistent patterns in high diversity, persistent across seasons in:
 - simple species richness (S) and
 - Shannon diversity (H').

Geological and Ecological Connections

- General faunal response to:
 - Grain size gradient (i.e., fine to coarse), and
 - Increasing tidal stress.
- Species shift from:
 - short-lived to long-lived fragile epifaunal species, and
 - burrowed sediments to shell reef coverage.

Finite Volume Community Ocean Model

- Modelling Results
 - Showed accordance with field measurements of:
 - Temperature,
 - Salinity,
 - Current, and
 - Bottom stress
 - Validated FVCOM use for spatial interpolation
 - Estimation of bottom stress is imprecise
 - Underestimates higher frequency and finer scale motions.

Phase I Pilot Outcomes

- Report and Appendices submitted June 2015
 - <https://longislandsoundstudy.net/research-monitoring/seafloor-mapping/>
- Consensus the pilot project was successful
 - Generated useful data and examples of how data can be visualized and synthesized
 - Demonstrated collaborative teams can be an effective at approaching complex, large scale efforts
- Areas for Improvement
 - Better definition and application of data standards
 - Improved coordination and communication (between teams as well as between teams and SC)

Phase II Mapping Initiative

Long Island Sound Mapping and Research Collaborative

NOAA Ocean Service Collaborative

National Centers for Coastal Ocean Science NCCOS

Office of Coast Survey OCS

Lamont - Doherty Earth Observatory Collaborative

Connecticut Department of Energy and Environmental Protection

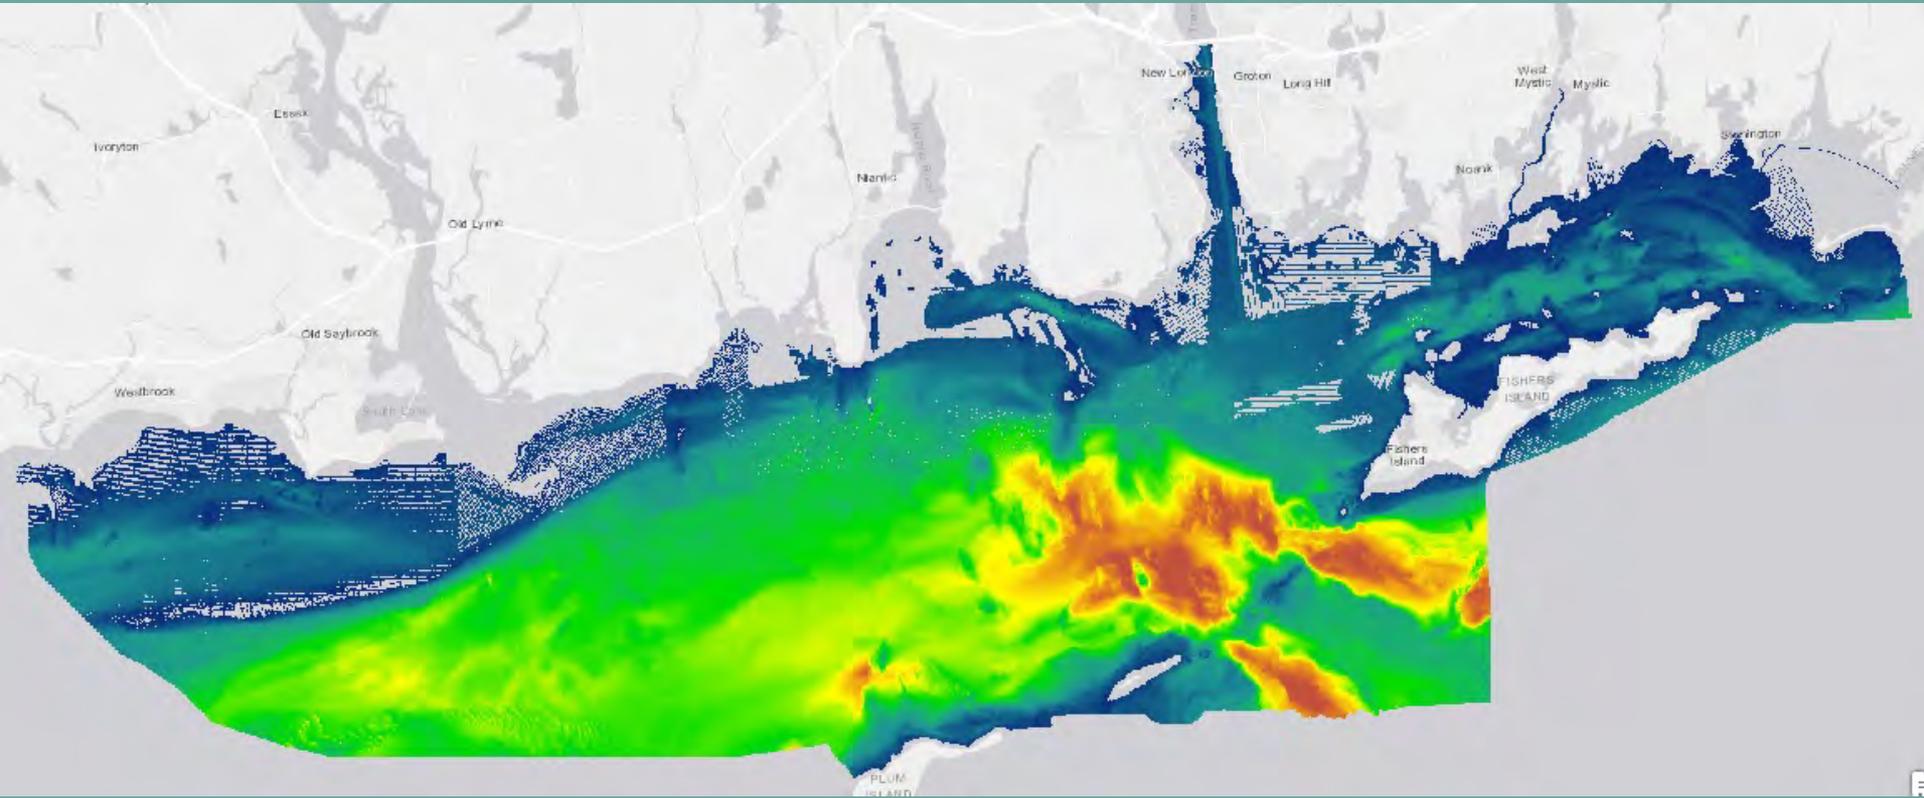

Phase II Mapping Goals

1. Product deliverables to identify/help understand:
 - ⇒ Predominant topographic, geologic, physical, and ecological characteristics
 - ⇒ Distribution of characteristics
 - ⇒ Physical, ecological or geological attributes/functions of an area based on various characteristics
2. Data collection & processing
3. Improvements to Pilot processes:
 - a. Communication/cohesiveness about standards and processes
 - b. Timelines and scheduling of inter-team dependencies
 - c. Earlier feedback on draft products
 - d. Distribution & access of final data products

Seafloor/Habitat Characterization

Acoustic patch types identified in the Phase II study area using eCognition

Connecticut Department of Energy and Environmental Protection

Ecological Sampling

Sites (blocks – multiple samples, sites – single samples)

Connecticut Department of Energy and Environmental Protection

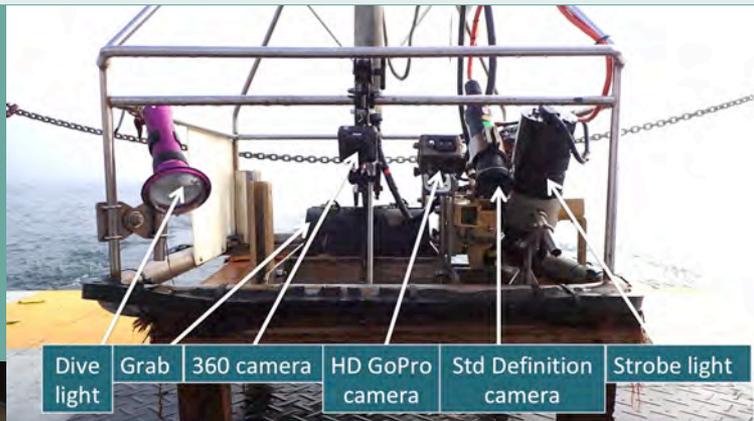

Ecological Sampling

- 40 sample *blocks* (1 km²)/50 sample *sites*: 3 random grab samples w/in blocks; 1/site
- Backscatter and bathymetry data used to refine video transects at sample blocks and sites (min of 3/block, 1/site).
- Transects were selected to maximize seafloor complexity & sediment transitions from one habitat type to another to delineate and validate boundaries between habitats

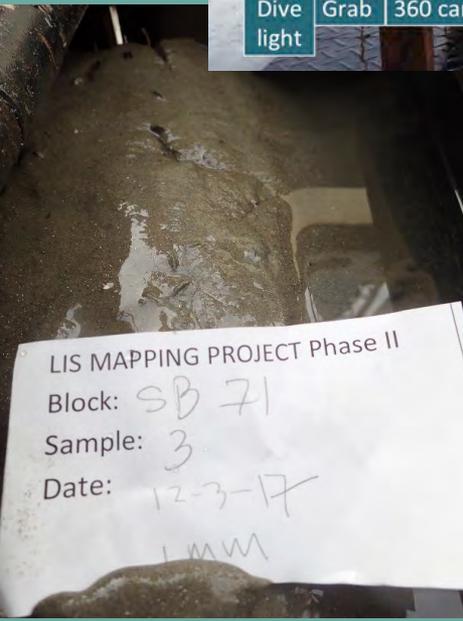

Ecological Characterization: Infauna

- Organisms and biogenic structures identified to lowest taxon in each cell

Ecological Characterization: Epifaunal

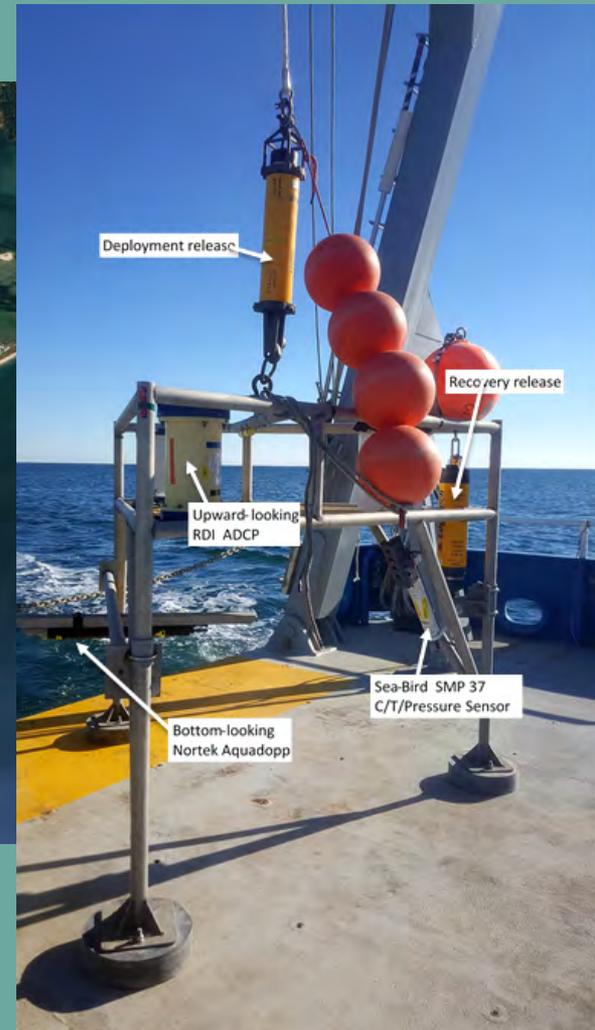

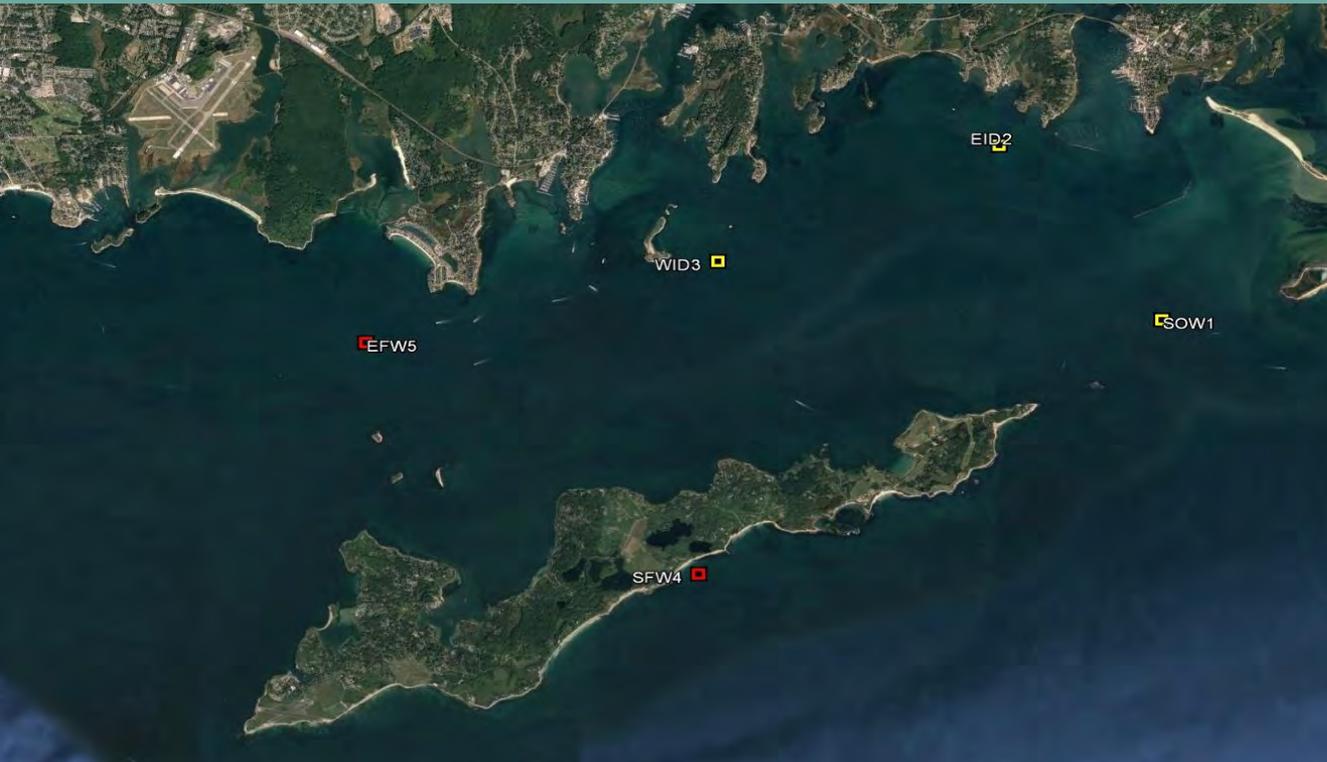

Spatial Variability of Taxonomic Richness

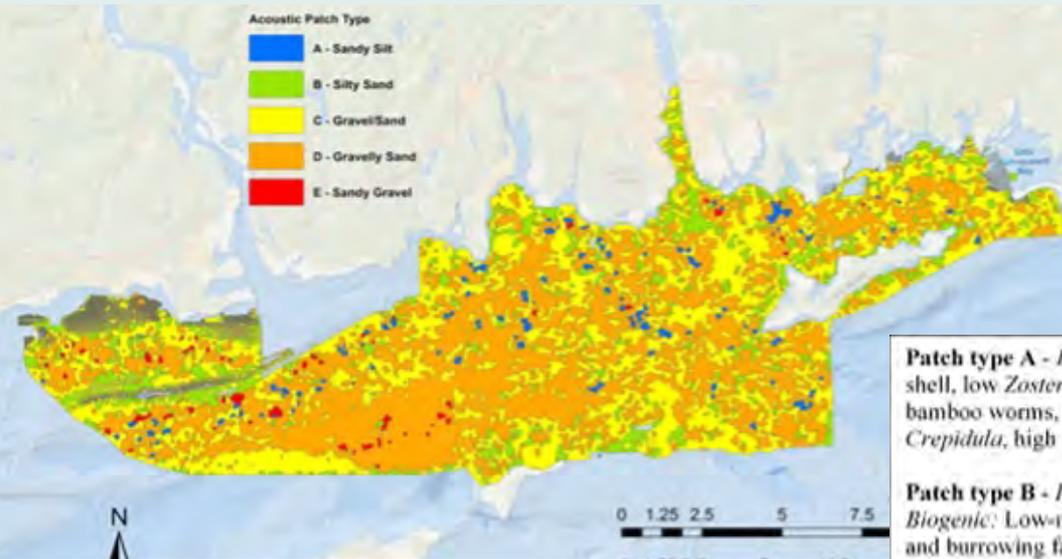

Physical Oceanography

Bottom observation platforms

Putting it all together...Integrated Habitat Map

Patch type A - Physical: Generally shallow, low complexity, low energy. **Biogenic:** Lowest coverage of shell, low *Zostera* debris; **Infaunal taxa:** Tube building and burrowing fauna, molluscs, *Ampelisca*, bamboo worms, burrowing anemones; **Epi-emergent-taxa:** Low hydrozoan-bryozoan turf, high *Crepidula*, high *Cliona*, high Rhodophyta (some shallow sites).

Patch type B - Physical: Moderate depths, moderate to high complexity, low to moderate energy. **Biogenic:** Low-mod shell coverage, moderate *Zostera* and terrestrial debris; **Infaunal taxa:** Tube building and burrowing fauna, hermit crabs, amphipods, bamboo worms, burrowing worms, sand dollars; **Epi-emergent-taxa:** Low-mod hydrozoan-bryozoan turf, low *Astrangia*, low *Crepidula*, low *Mytilus*, *Diadumene*, *Corymorpha* (winter-spring), *Cliona*, high Rhodophyta cover at some shallow sites.

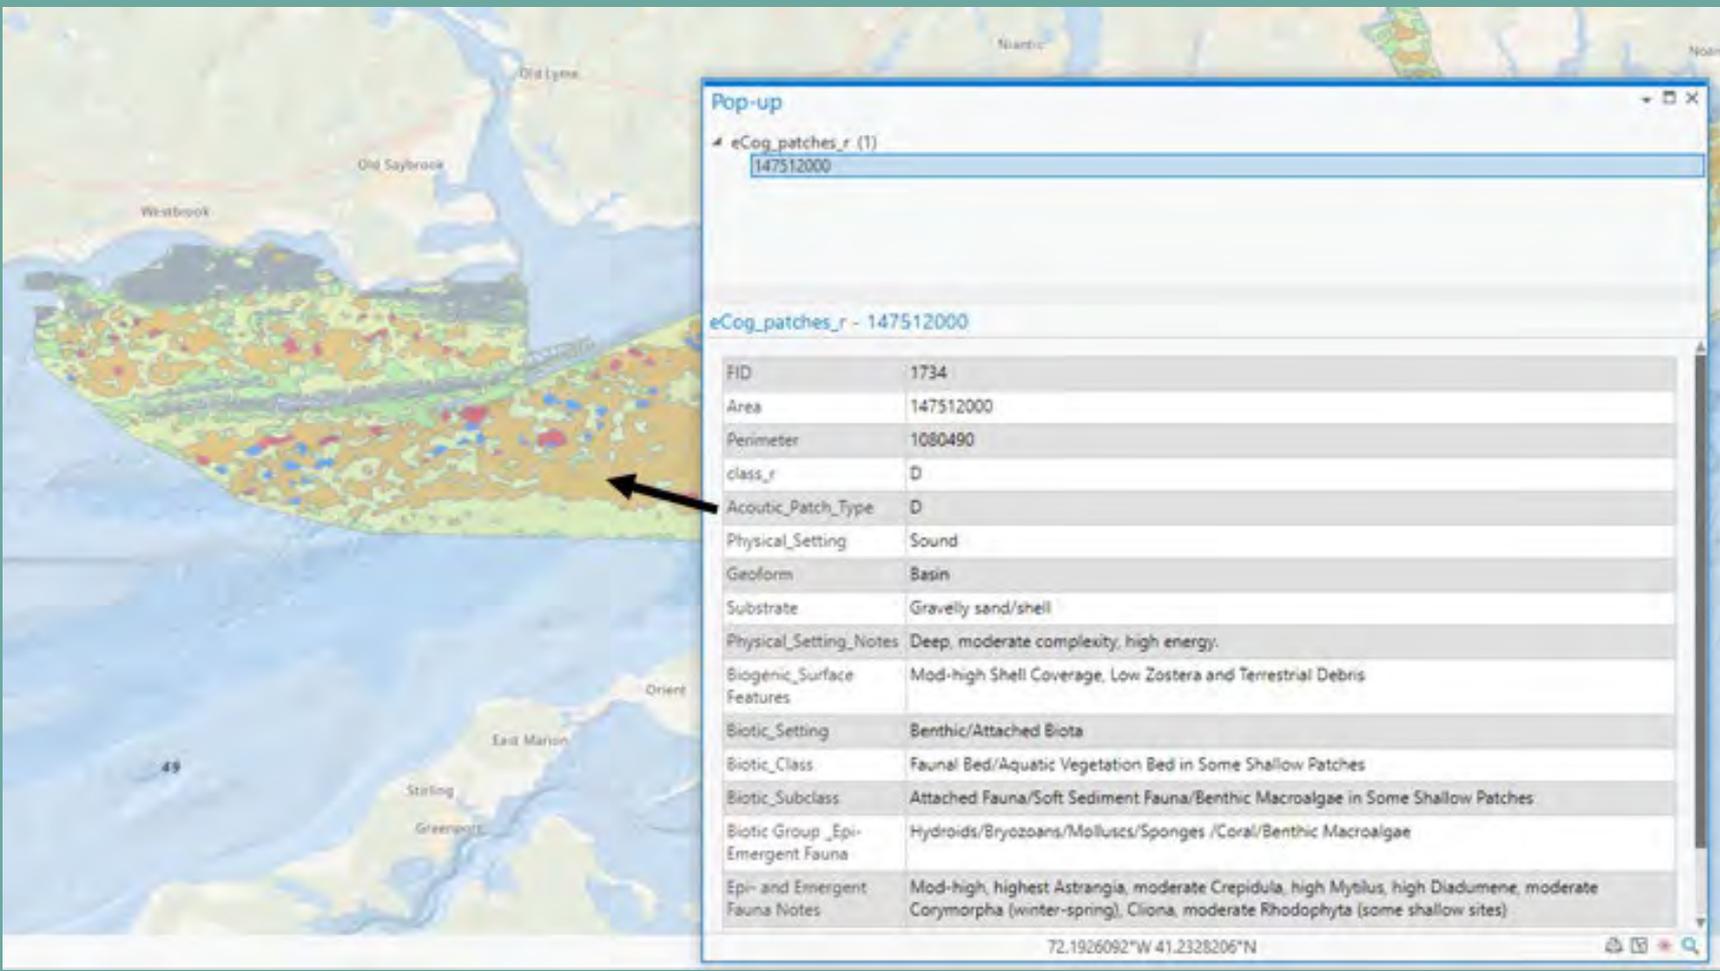

Patch type C - Physical: Deepest, highest complexity, moderate to high energy; **Biogenic:** Moderate shell coverage, moderate *Zostera* and terrestrial debris; **Infaunal Taxa:** Tube building and burrowing Fauna, molluscs, *Astarte* spp., amphipods, bamboo worms, burrowing worms, sand dollars; **Epi-emergent-taxa:** Moderate hydrozoan-bryozoan turf, moderate *Astrangia*, moderate *Crepidula*, moderate *Mytilus*, *Diadumene*, moderate *Corymorpha* (winter-spring), *Cliona*, moderate Rhodophyta (some shallow sites).

Patch type D - Physical: Deep, moderate complexity, highest energy; **Biogenic:** Mod-high shell coverage, low *Zostera* and terrestrial debris; **Infaunal Taxa:** Molluscs, *Astarte* spp., tube building and burrowing fauna, amphipods, bamboo worms, sand dollars. **Epi-emergent-taxa:** Moderate-high to highest *Astrangia*, moderate *Crepidula*, high *Mytilus*, high *Diadumene*, moderate *Corymorpha* (winter-spring), *Cliona*, moderate Rhodophyta (some shallow sites).

Patch type E - Physical: Shallow to moderate depths, low complexity, high energy; **Biogenic:** Highest coverage of shell; **Infaunal taxa:** Molluscs, *Astarte* spp. tube building and burrowing fauna, ophiuroids, sand dollars; **Epi-emergent-taxa:** Highest hydrozoan-bryozoan turf, high *Astrangia*, low *Crepidula*, moderate *Mytilus*, high *Corymorpha* (winter-spring).

Putting it all together....CMECS

Completing the Phase II Initiative

Sediment coring operations on the RV Pritchard

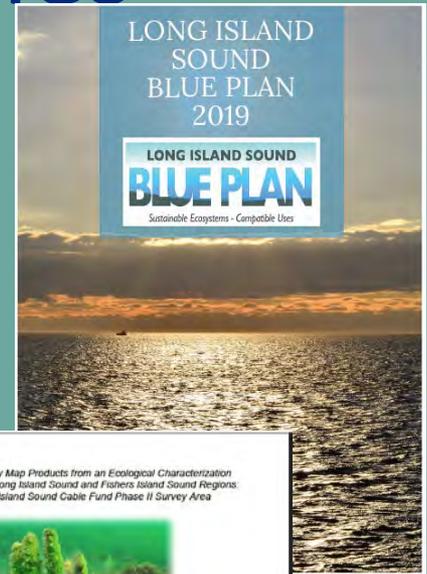

Students assisting with sediment coring operations on the RV Pritchard

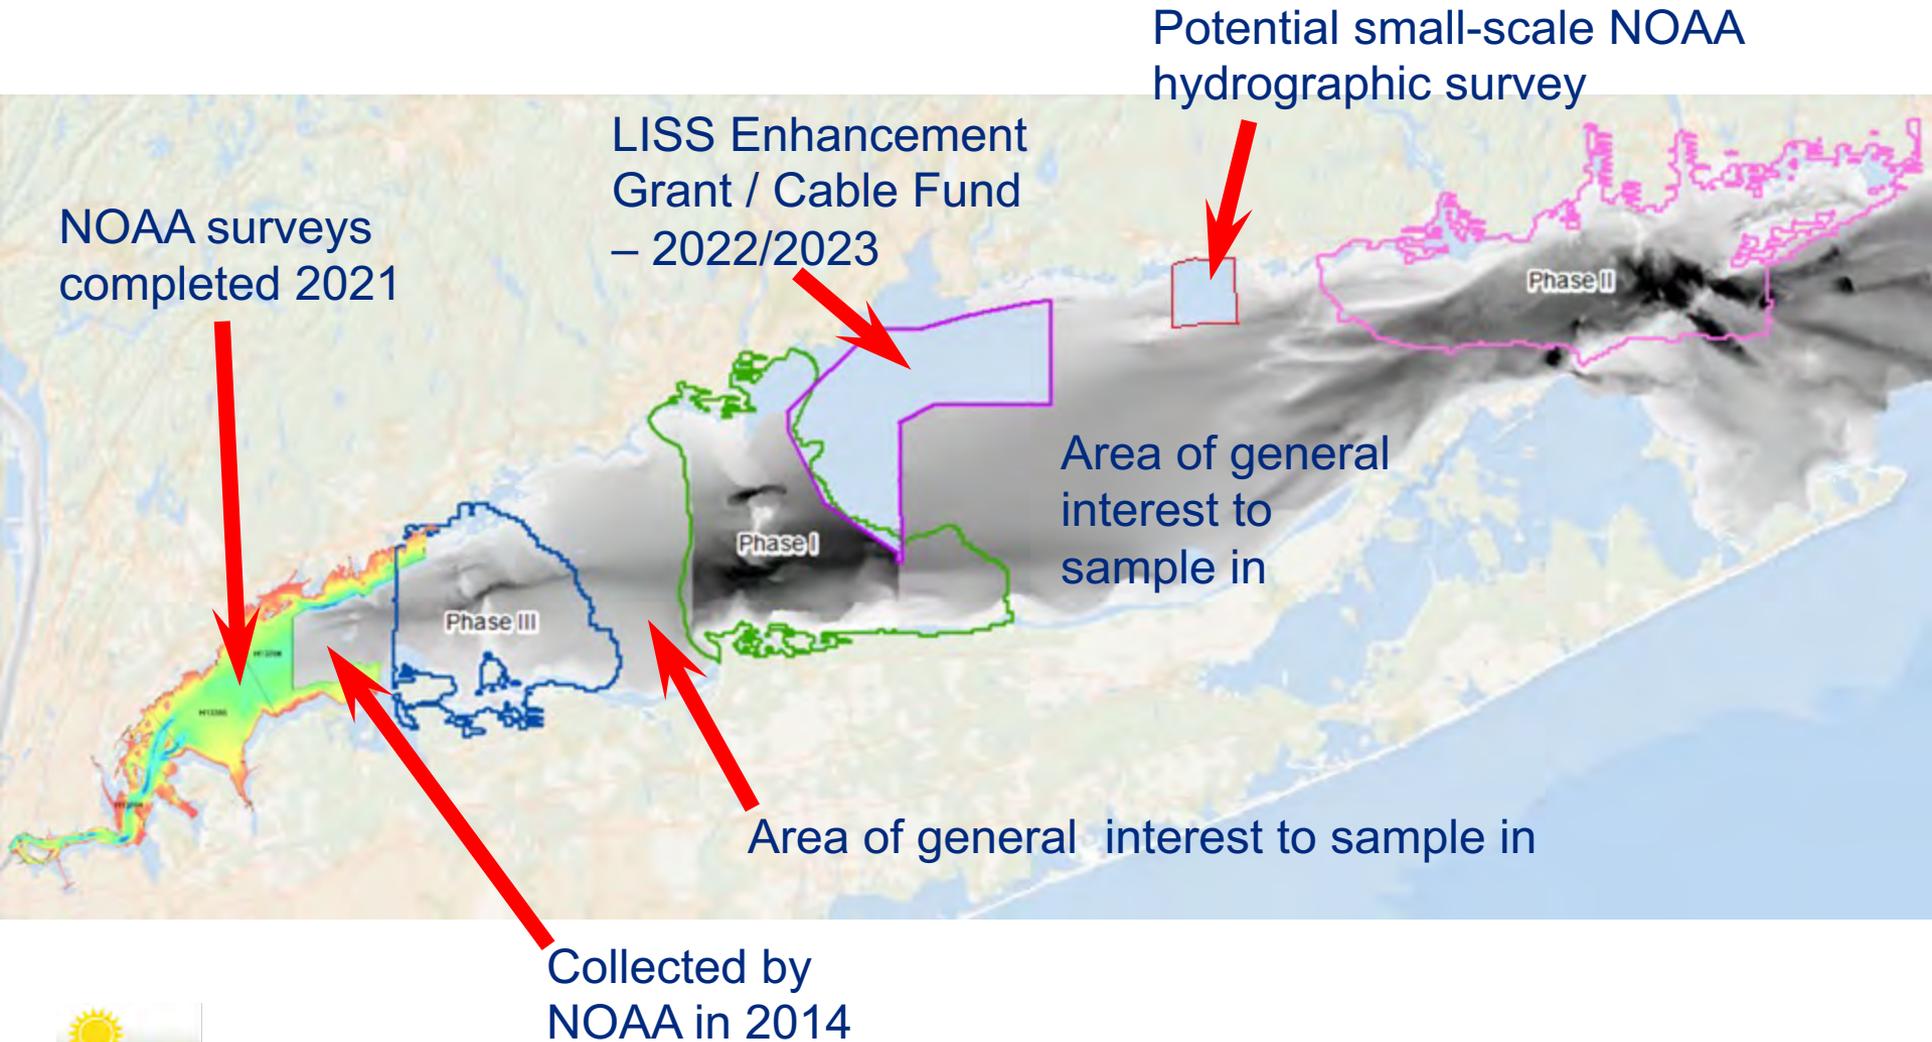

Phase I and II Outcomes

- Results were included in the LIS Blue Plan inventory (eg cold water corals, areas of seafloor complexity)
- A preliminary report was generated in 2021 to guide cable routing decisions in LIS 2021
- Data were provided to NYSERDA to also guide cable routing
